

Task 3 - List of features and functionalities can be build using Artificial Intelligence & Machine Learning

AI/ML Features and Functionalities

- **Object Detection -**
 - Explanation: AI systems can identify and locate objects in images or videos.
 - Real - Life Example: Security cameras detect cars and people in parking lots to prevent accidents.

- **Movement Tracking -**
 - Explanation: AI can follow and monitor the movement of objects or people over time.
 - Real - Life Example: Fitness apps track your running path and steps using your phone's sensors.

- **Face ID (on Mobile) -**
 - Explanation: AI recognizes and verifies a person's face for authentication.
 - Real - Life Example: Unlocking your iPhone or Android device using facial recognition instead of a password.

- **Sentiment Analysis -**
 - Explanation: AI analyzes text or speech to understand emotions (positive, negative, neutral).
 - Real - Life Example: Companies use sentiment analysis on customer reviews to see if people are happy or upset with their products.

- Audio to Text (Speech Recognition) -
 - Explanation: AI converts spoken words into written text.
 - Real - Life Example: Google Assistant transcribes your voice commands into text to perform searches.
- Text to Audio (Speech Synthesis) -
 - Explanation: AI converts written text into spoken voice.
 - Real - Life Example: Audiobook apps use text-to-speech to read books aloud for visually impaired users.
- Document Verification in Live Meetings -
 - Explanation: AI verifies documents (like ID cards or certificates) in real-time during online meetings.
 - Real - Life Example: During a virtual job interview, AI checks the candidate's ID card through the webcam to confirm authenticity.

Conclusion

AI/ML technologies provide powerful features that make everyday tasks easier, safer, and more efficient. From unlocking phones with your face to analyzing customer emotions, these functionalities are already part of our daily lives and continue to grow in importance.
