

Patient Care Dashboard Report

1. Overview

The Patient Care Dashboard provides a comprehensive view of hospital operations, focusing on patient admissions, discharges, length of stay, severity levels, and readmission patterns. The dashboard enables stakeholders to monitor hospital performance, patient flow, and healthcare quality metrics effectively.

2. Objectives

- Track patient admissions and discharges
- Analyze average length of stay (ALOS)
- Monitor readmission rates
- Evaluate patient severity levels

- Understand department-wise workload distribution
 - Identify trends and patterns in patient care
-

3. Dataset Description

The dataset includes patient-level information with the following key attributes:

- Patient_ID: Unique identifier for each patient
 - Admission_Date & Discharge_Date: Timeline of hospital stay
 - Age, Age_Group, Gender: Demographic details
 - Condition_Type: Patient diagnosis
 - Department: Hospital unit handling the patient
 - Severity_Score: Indicates criticality of the patient
 - Length_of_Stay: Duration of hospitalization
 - Insurance_Type: Payment/coverage type
 - Discharge_Status: Outcome (Home, Rehab, Expired)
 - Readmission_Within_30_Days: Indicates repeat admission
-

4. Key Performance Indicators (KPIs)

Total Admission	Discharged Patients	Avg Length of Stay	Re-admission %	Avg Severity
500	393	8.80	18%	5.23

4.1 Total Admissions

- **Value:** 500
- Represents the total number of patients admitted to the hospital.

4.2 Discharged Patients

- **Value:** 393

- Indicates the number of patients successfully discharged.

4.3 Average Length of Stay (ALOS)

- **Value:** 8.80 days
- Measures the average duration patients spend in the hospital.

4.4 Readmission Rate

- **Value:** 18%
- Percentage of patients readmitted within 30 days, reflecting quality of care.

4.5 Average Severity Score

- **Value:** 5.23
- Represents the average criticality level of patients.

5. Dashboard Visualizations

5.1 Patient Admissions Trend (Line Chart)

- Displays monthly patient admissions.
 - Peak observed in **December (48 patients)** and **October (46 patients)**.
 - Lowest admissions recorded in **March (35 patients)**.
 - **Insight:** Helps identify seasonal trends and resource planning needs.
-

5.2 Total Length of Stay by Condition (Donut Chart)

- Shows distribution of hospitalization time across conditions.
 - Major contributors:
 - Heart Failure (15.68%)
 - Alzheimer's (13.63%)
 - Stroke (12.32%)
 - **Insight:** Chronic conditions contribute significantly to longer hospital stays.
-

5.3 Department-wise Patient Count (Bar Chart)

- ICU has the highest patient count (100).
 - Followed by:
 - Geriatrics (59)
 - Orthopedics (56)
 - Lowest: Endocrinology (39)
 - **Insight:** ICU is the most resource-intensive department.
-

5.4 Discharge Status by Gender (Clustered Bar Chart)

- Majority of patients are discharged **Home** across all genders.
 - Small number of:
 - Transfers to Rehab
 - Expired cases
 - **Insight:** High discharge-to-home rate indicates effective treatment outcomes.
-

6. Slicers (Filters)

The dashboard includes interactive slicers for:

- Age Group
- Gender
- Department
- Insurance Type
- Readmission Status

Purpose:

Allows users to drill down into specific patient segments for deeper analysis.

7. Key Insights

- Patient admissions show **fluctuating monthly trends**, with peaks toward year-end.
 - **ICU handles the highest number of cases**, indicating critical care demand.
 - **Heart-related and neurological conditions** contribute most to hospital stay duration.
 - **Readmission rate of 18%** suggests moderate scope for improving post-discharge care.
 - Majority of patients are discharged home, indicating **positive treatment outcomes**.
 - Severity score indicates a **moderate overall patient criticality level**.
-

8. Conclusion

The Patient Care Dashboard effectively consolidates critical healthcare metrics into a single interactive view. It enables hospital management to monitor operational efficiency, patient outcomes, and resource utilization. The insights derived can support data-driven decision-making to improve patient care quality and hospital performance.
