

Task 12.2 Customer Behavior Dashboard – Analysis Report

Dashboard Overview

Dashboard analyzes customer behavior in an e-commerce environment. It focuses on how customers interact with products, how they make purchase decisions, and how factors such as device usage, discounts, and social media influence purchasing patterns. The dashboard combines key performance indicators (KPIs) with visual charts to provide a comprehensive view of customer engagement, satisfaction, and spending behavior.

Key Performance Indicators (KPIs)

Total Revenue: Shows the total sales generated from all purchases. It helps understand the overall financial performance of the business.

Total Orders: Represents the total number of purchases made by customers.

Average Customer Satisfaction: Measures how satisfied customers are with their purchases and overall shopping experience.

Average Order Value: Indicates the average amount spent per order, helping businesses understand customer spending patterns.

Total Customers Using Discounts: Displays how many customers used discounts when making purchases, highlighting price sensitivity.

Chart Analysis and Business Questions

Total Purchase Amount by Device Used for Shopping

Question: Which device do customers use the most for shopping?

This chart shows how much revenue is generated from different shopping devices such as smartphones, tablets, and desktops. The analysis helps businesses optimize their platform for the most commonly used devices.

Customer Satisfaction by Purchase Category

Question: Which product categories provide the highest customer satisfaction?

The treemap highlights satisfaction scores across different product categories. This helps businesses identify categories performing well and those needing improvement.

Total Purchase Amount by Discount Used

Question: Do discounts influence purchasing behavior?

This donut chart compares purchases made with and without discounts. It helps identify whether discounts are driving customer purchases.

Customer Count by Purchase Channel

Question: Which purchasing channel do customers prefer?

This chart compares the number of customers shopping through online, in-store, or mixed channels. It provides insight into customer shopping preferences.

Total Time Spent on Product Research by Social Media Influence

Question: Does social media influence customer research behavior?

This chart shows how much time customers spend researching products based on different levels of social media influence.

Total Purchase Amount by Purchase Intent

Question: What type of buying intent generates the most revenue?

The chart shows revenue generated by different purchase intentions such as wants-based, needs-based, planned, and impulsive purchases.

Slicer Analysis

Customer_Loyalty_Prog...	Shipping_Preference	Payment_Method	Discount_Sensitivity
All	All	All	All

Customer Loyalty Program Member

Allows users to compare behavior between loyalty members and non-members.

Shipping Preference

Helps analyze whether customers prefer faster shipping options or standard delivery.

Payment Method

Allows analysis of preferred payment methods such as cards, digital wallets, or other methods.

Discount Sensitivity

Helps understand whether customers are highly sensitive to discounts or not.

Customer Behavior Insights

The dashboard highlights several key customer behavior patterns:

- Customers using certain devices generate higher purchase amounts.
- Some product categories have higher customer satisfaction than others.
- Discounts significantly influence purchasing behavior.
- Customers shop through multiple channels including online and in-store.
- Social media influence affects how long customers research products before purchasing.
- Purchases driven by wants and needs generate more revenue than impulsive purchases.

Conclusion

This dashboard provides a comprehensive view of customer purchasing patterns and engagement behavior. Businesses can use these insights to improve marketing strategies, optimize customer experience, and increase sales performance.

Learnings

While adding measure to Gauge chart the data count changed. Adding measure maximum value changes the output.

For KPIs the data formatting is required for correct value.
